

서울대학교 인지과학연구소 조정강연회

발표자	Prof. Dr. Heinrich Bülthoff (Max Planck Institute for Biological Cybernetics, Germany)
제목	Towards artificial systems: what can we learn from human perception

일시: 2010년 9월 9일 (목) 오전 11시 ~ 12시

장소: 신양 인문학술정보관 국제회의실

발표 개요

The question of how we perceive and interact with the world around us has been at the heart of cognitive and neuroscience research for the last decades. Despite tremendous advances in the field of computational vision made possible by the development of powerful learning techniques as well as the existence of large amounts of labeled training data for harvesting - artificial systems have yet to reach human performance levels and generalization capabilities. In this contribution we want to highlight some recent results from perceptual studies that could help to bring artificial systems a few steps closer to this grand goal. In particular, we focus on the issue of spatio-temporal object representations (dynamic faces), face synthesis, as well as the need for taking into account multi-sensory data in models of object categorization. Having understood the important role of haptic feedback for human perception, we also explored new ways of exploiting it for helping humans (pilots) in solving difficult control tasks. This recent work on human machine interfaces naturally extends to the case of autonomous or intelligent machines such as robots that are currently envisioned to be pervasive in our society and closely cooperate with humans in their tasks. In all of these perceptual research lines, the underlying research philosophy was to combine the latest tools in computer vision, computer graphics, and virtual reality technology in order to gain a deeper understanding of biological information processing. Conversely, we discuss how the perceptual results can feed back into the design of better and more efficient tools for artificial systems.
